1. Proven in vitro to significantly (p=0.0133) inhibit bacterial attachment and biofilm formation¹ as compared with a commonly used polyurethane catheter².
2. The POWERWAND is proven in vivo to be thromboresistant with respect to both thrombus on the surface of the catheter and thrombus on the wall of the vein. Based on canine jugular vein thromboresistance study, correlations to clinical applications has not been ascertained. † Based on laboratory test results which may not be indicative of clinical results. Data on file and refer to publication³. Preclinical in-vitro evaluations do not necessarily predict clinical performance with respect to catheter-related bloodstream infection.
